Internal GPS units

Outputting iGPS Data onto NMEA 2000 Network

The latest software updates installed on internal GPS units will now output their GPS data on a NMEA 2000 network. When the iGPS unit is powered and has a GPS lock, it will output its data onto the NMEA 2000 network and allow other devices on the network to display GPS information, eliminating the need for an external GPS antenna.

The iGPS unit can provide GPS data over the NMEA 2000 network without an external antenna.
